Author: Przemysław S. Knycz - <https://fb.com/djrzulf/> - **email:** przemyslaw@knycz.net - **phone** +48601391681

Hello.

I have performed over 600 treatments and according to blood results, bioresonance scans (not only my hardware), symptoms, surveys and all the tools we use to help revitalization, we have a problem with three sources of diseases:

borreliosis, of which we have 260 species according to Łukasz Lubicki - unfortunately, it looks like ineffective antibiotic therapy causes its mutations and we do not really know how much longer species is,

overgrowth of candida, which 197 species are identified, growing from antibiotic therapy and diet overloaded with simple sugars - <http://janus.net.pl/> (Polish language)

and **staphylococci** and **streptococci** (and especially **pneumococcus**), which we have over 60 species.

This gives us over 500 symptoms only from these three sources.

What are the most popular symptoms of people who reach us?

Most often they are dizziness, scars in front of eyes and blurred vision (blurring image, double vision or narrowing of the field of view), moreover, we observe that often also fatigue occurs (drowsiness, yawning, problems with concentration). These are symptoms of brain hypoxia, primarily the posterior part of the brain that powers the cerebellum, which he is primarily responsible for the stability of our posture and the posterior occipital lobe, where eyes are folded.

Why are we hypoxic?

Look at the LookO2 or Airly air sensors. I personally monitor the air from November 2016 and unfortunately, within 13 months there was a whole 9 days of transparency such that with Rudzica was seen in Katowice. If it does not blow, Tychy can barely see, and if it's terrible, it's barely you can see Pszczyna. How does it affect us? There is a great episode of the TV series called "Once Upon a Time... Life" - The war with toxins, No. 21 - you find it on Google. Lung-cleansing enzymes consume enough a lot of oxygen, and that pollution is more than that oxygen is on our needs, it decreases its quantity on the perimeter and our problems begin.

What else happens to people who reach us?

Problems with short-term memory ("I went to the kitchen and ... I forgot what for"), the problems with concentration, diseases of the endocrine system (pollakiuria - manifesting frequent piss at night, cold hands and legs, problems with thermoregulation - reduced body temperature up to 35 degrees or hot flushes) and autoimmune diseases - related primarily all with tyrosine deficiency from food. Here we do not know if this is a matter too small supply of phenylalanine or simply impaired digestion from fungal infections of the digestive system ...

For deficiencies of **tryptophan** (the precursor of serotonin) - the symptoms are:

photosensitivity to sunlight, amblyopia after dark, anxiety or depression, bad thoughts, attacks of aggression, reduced sweating and sunburn (i.e. once we were tanning and now we are sunbathing in red).

Other symptoms, this time from **Lyme disease**, are migraine pain - tendons, muscles, joints, bones - mainly related to the impairment of collagen regeneration.

Systemic mycosis is usually manifested by raids on the tongue (with different color and intensity), bad breath in the morning or during the day, not related to food, recurrent fungal infections of intimate places or foot fungal infections. No, you did not catch somewhere fungus, it's just an overgrowth of mycosis from your center that goes outside and you should immediately put away the simple sugars, besides Lyme disease itself. Recent studies show that Lyme disease with fungi, fed with simple sugars it produces morphine in our body, so think about how often you have sweet contractions and are you able to put it away easily? Well, some have a bad feelings for two weeks, as if they were putting away hard drugs ... Well, but morphine, this is a tough drug - now you already know why some have such a problem to put aside?

Staphylococci and **streptococci** affect neurotransmitter disorders in our brain, unfortunately this topic is explored for now, because it is very complicated and multilevel, while we know for sure that they interfere with the reception or synthesis of serotonin and dopamine in the brain, resulting in symptoms of a tryptophan or tyrosine deficiency.

Fortunately, a lot of patients after the start of supplementation with oxygen, tyrosine and tryptophan (and basically niacin, which unfortunately has a metabolic pathway that steals tryptophan for us) notes a significant improvement in health.

Unfortunately, there are a few cases that react badly to these supplements, which is why we are introducing always in smaller doses and in case of worsening symptoms, we go back to the dose on which we felt well.

Why are these three supplements the most important?

- **oxygen** supplies ammunition to our immune system and cells to allow fly on oxygen glycolysis (without the production of lactic acid),
- **tyrosine** accelerates the maturation of lymphocytes in the thymus,
- **niacin** prevents the stealing of tryptophan, and at the same time provides substrates to energy regeneration.

Why do not you learn from the system doctor but from alternative medicine?

A good question, ask your doctor, laugh at you about Lyme disease (they think you can to heal it in 3 or 6 weeks, some people recover from Lyme disease after a few months, and go to patients who heal themselves after several years or several years without a success). In classical medicine there is also a widespread belief that "**fashion for Lyme disease**" - it's not fashion - **it is FACT**, Lyme disease gives a multitude of symptoms, and additionally impaired diagnostics (mainly serologic) does not give an unambiguous answer whether we are suffering from Lyme disease or not. If you have any antibodies in Western Blot bars that means that's what the antibodies are for there is an infection (after all, the immune system does not leave anything in store in our blood!), the same remember - the antibodies may not be at all or there will be traces of them if it is in the tissue.

Unfortunately, borreliosis, from what we observe, accelerates the aging process (graying, baldness, menopause in women aged 40 ...).

In the **fungal** do not believe or how they believe, they know about her and think that she does not give symptoms. Some laboratories allow the study of Candida IgG and IgM, but we do not have enough extensive experience in reading these tests - people with chronic mycosis often it is already positive.

Staphylococci and **streptococci** - they live on our body and wait for the right moment of attack. They often come out of the ear, throat, nasal smear ... Well, the medical system heals it antibiotic. No matter if you eat a probiotic, a prebiotic, or a bucket of such a mix, nothing will help you a fungus that will be spread throughout your body as a result of antibiotic therapy. So think about whether it is worth poisoning, if it is really Lyme disease together with staphylococci and streptococcus you get oxygen (after all it's anaerobic bacteria), you'll have mycosis he stayed longer because she takes up tissues and you need a few ways to get rid of her.

Okay, but what about diseases like cancer, schizophrenia, Alzheimer's and others?

It's all a mix of these three sources upstairs, in the case of cancer - it's long-lasting organism mycosis, which reduces the pH of the body and forces the cells to switch to anaerobic glycolysis in terms of mental illness - these are deficiencies in neurotransmission within the brain, parkinson - again, neurotransmitters + hypoxia (which damages the essence black neurons) ...

I hope that I have brought you a little bit of our health problems society. I encourage you to view my speech about health in the system and about Lyme.

Check my "**Public research on internal use of hydrogen peroxide**" - <http://alt-e.eu/oxygen/>

All materials about of health are available on the Youtube portal and on my site (mainly in Polish) - <http://www.alt-e.eu/>
